LRM Feedback (11-8-2013)

- Introduction
    - Define a program
    - What is the compilation process?
- Add semantic difference between list of notes and a chord
- Random, print should be library functions (special case) instead of keywords
- Be more specific on what you can do with functions
- Expressions
    - Dividing things into parts gets confusing: Make one list
    - Let expressions are different still
- %+ and %- should be available for notes (changes the register of the note)
- Only specify new lines when talking about program (not expressions) because nesting expressions gets complicated with newlines in the grammar
    - Declarations and Bindings, Definitions: Instead of newline, you might want to define a program as a list of let expressions separated by newlines
- Do we need & as a separator? Think about nesting
